CardKeep Release Notes

All versions, 0.1.0 to 0.6.2 · October 2026

What's new in 0.6.2

0.6.2 is the hardening release that follows the 0.6 security and privacy audit. It changes little you will see day to day, and a lot about how safely your data is kept.

- **Your data stays yours.** CardKeep is no longer copied into Google's cloud backup or device transfer, unused permissions (microphone, media, storage) are gone, reminders hide who they are about on the lock screen, and a new **Hide in recent apps** switch keeps your contacts out of the app switcher.
- **Backups you can trust.** Restores check the file strictly and finish safely even if the phone turns off mid-way (0.6.1). The data from before a restore can be brought back or discarded.
- **Nothing lost while scanning.** Every capture is kept on disk until its card is in the review queue (0.6.1); a photo that can never be read is set aside after three tries instead of retried forever.
- **Deleted means deleted.** Contacts are wiped for good 7 days after you delete them, with their photos, and never go into backups (0.6.1).
- **Safer updates.** Downloads must match GitHub's checksum and recover cleanly from a dropped connection.
- **Easier to use.** Bigger touch targets, Back returns to Contacts from any area, and a placeholder menu entry is gone.

Before updating: nothing to do. Updates keep your contacts. Because CardKeep is now excluded from Android's own backup, make a CardKeep backup (Export and backup → Back up now) before you change phones.

Known limits: not on Google Play yet; no app lock; no sync with a computer; the database is not encrypted on the phone (it is in CardKeep's private storage).

Full history

Version 0.6.2 (2026-10-22)

Added

- **Hide in recent apps** (Settings > Privacy, off by default): blanks CardKeep in the app switcher and blocks screenshots.
- **Data from before the last restore** (Export and backup): go back to it or discard it; it is removed after 30 days.

Changed

- Contacts are no longer included in Google cloud backup or device transfer.
- Unused permissions (microphone, media, storage) removed.
- Reminders no longer show the contact on the lock screen.
- "Sync to desktop" is hidden until it exists; Back from any section returns to Contacts.
- Larger touch targets on the round header buttons and the scan mode selector.

Fixed

- Restoring checks the backup more strictly (unlisted files, database integrity, size limits).
- An update download that fails or is cut off says so instead of hanging; updates must match GitHub's checksum.
- A capture that cannot be read after 3 tries is set aside instead of retried on every start.
- Large CSV imports and very long text on a card no longer freeze the app; a bad web address no longer crashes it.
- Job changes, imports, event deletes and card links are saved all-or-nothing.
- Discarding a card no longer deletes an image another card still uses.

Version 0.6.1 (2026-10-22)

Fixed

- A restore interrupted at any point (phone off, app killed) now finishes on the next start; nothing is lost, and you are told whether it worked.
- Cards captured but not yet read are kept on disk until they are in the review queue, so closing the app mid-scan no longer loses them.
- Deleted contacts are wiped for good after 7 days, with their card photos and logos, and are never included in backups.
- ML Kit's usage logging to Google is switched off: text recognition stays fully on the phone.

Version 0.6.0 (2026-10-21)

Added

- **Tap cards (NFC)** (drawer, or + → Tap an NFC card): hold a tap card to the back of the phone, then the next one; each gives a buzz and a row. A contact card opens the review form to save (with the open event and the duplicate and job-change checks); a link card can be opened in your browser or saved as a link only (tagged "NFC link"); text can be copied. The same card tapped again within 3 seconds is ignored, including cards whose link changes on every tap. Payment cards and door badges are not read. With NFC off there's a button to its settings.

Version 0.5.0 (2026-10-21)

Added

- **Export** (drawer → Export and backup): everyone, a tag or an event, as vCard 3.0/4.0, CSV, HubSpot CSV or Salesforce CSV; with or without notes; optionally zipped with the card photos. **Share**, or **Save to…** any folder. Phone extensions and fax numbers are included.
- **Import** (drawer): vCard files (also by opening or sharing a .vcf from another app) and spreadsheets (.csv) with a column-matching screen and preview; the matching is remembered. Imported people get the **Imported** tag; someone you already have is updated instead of added twice, and someone at a new company shows up in Career moves.
- **Backup and restore**: one zip with contacts, card photos, tags, events and settings, checked before restoring (refuses damaged files and backups from a newer CardKeep). Your current data is kept as a fallback copy. Optional **weekly backup** on the phone (last 4 kept).
- **My card**: your own details as a QR code (tap for full screen at full brightness) and as a contact file to share.

Version 0.4.0 (2026-10-21)

Added

- **Career moves** (drawer): when a new card shows someone you have at another company, or you mark an email as bounced (long-press it), they're listed to confirm. **Add as new role, keep history** (the old job and work email stay as history), **Replace old details**, or **Different person**.
- **Changed jobs…** and **Mark retired…** in a contact's ⋯ menu, with an optional replacement: their page shows **Replaced by** (with call and email), the replacement's shows **Replaces**, and an open follow-up can move to the replacement. **Not retired** undoes it.
- Settings: **Career tracking** on or off for everyone (each contact can still opt out on their edit page).

Version 0.3.1 (2026-10-21)

Added

- **Follow-ups** (drawer, or the "due this week" banner): Overdue, This week and Later. Mark one done, push it to tomorrow, 3 days or next week, or **draft the follow-up email** in your mail app (marked done only when you say it was sent).
- **Reminders**: a notification on the follow-up day (around 8:00); tapping it opens the contact. Android asks once for permission. Reminders survive a restart of the phone.
- Event page: **Follow up with everyone** sets a follow-up for everyone met there, on the end date plus the event's reminder days.

Version 0.3.0 (2026-10-21)

Added

- **Phone extensions** ("Ext. 112") are kept with the number and dialled after a pause; **fax numbers** are kept as their own line (shown and copied, never dialled).
- **Middle name or initial** on contacts ("Dana K. Reyes"), filled from the card.
- Names printed in capitals are re-cased ("FRED PANETO" → "Fred Paneto", keeping McDonald, O'Brien and hyphens); titles too ("PLANT MANAGER" → "Plant Manager", keeping VP, CEO and similar).

- **More from the card**: licence numbers, opening hours, social handles, "since 1985" and slogans are sorted into labelled lines instead of notes, and can be edited.
- **Company logo** cut from the card becomes the contact's picture (More → Remove logo to undo).
- **Others at this company** on a contact's page.
- **+ menu** on Contacts: Scan a card, Scan a stack, Add by hand, Import card photos.
- Sort names by **first or last name** (Settings, or the switch under the sort control).
- **Lead ratings can be switched off** (Settings, or the menu on the edit page); they disappear everywhere.
- Themes: **Navy and brass dark** added; Medium removed (it was too close to Light; it now shows as Light).

Fixed

- Card reading: "1" read as "I" and "0" as "O" inside phone numbers is corrected, so numbers and extensions are no longer dropped; addresses with a spelled-out state ("Eastlake, Ohio 44095") are read in full; a label left on its own ("E-Mail") no longer ends up in notes.
- **Events** (drawer): trade shows and networking events with dates, location, booth, a contact goal and notes. **Start scanning for this event** opens a scan session: every card scanned goes with the event (shown on the scanner), and contacts saved from those cards are marked "Met at" it. An event page shows the goal ring, cards, contacts, companies and follow-ups, and who you met. Events set to auto-start open their session the first time you open CardKeep on an event day.

Version 0.2.2 (2026-10-20)

Fixed

- Scanning on a phone: the release build couldn't read text or QR codes (Android's code shrinker removed parts of the on-device reader), so the scanner captured, showed "Reading card..." and started over. Cards are read again.
- If reading a card ever fails, the card is kept (fill it in by hand) and the scanner says so instead of looping.

Version 0.2.1 (2026-10-20)

Added

- **Tags** (drawer): your own groups with a name and colour. Add them on a contact's page, or select several contacts and tap the tag button. Tags appear as filters on Contacts and are searchable. Deleting a tag asks first and says how many people have it; the contacts stay.
- **Duplicates** (drawer): people who look like the same person (same mobile, or the same name with the same email or company), each with the reason. **Compare and merge** picks the name, title and rating per field and combines phones, emails, cards, tags and notes; **Undo merge** works until CardKeep closes. "Not the same person" is remembered. A contact's page shows a possible duplicate as soon as one exists (for example after a rescan).
- After a capture the card is shown being read: a scan line sweeps it, then each detail it found lights up in its field colour with a label (Name, Title, Company, Phone, Email...). Skipped when the phone asks for less motion.

Fixed

- Scanner no longer loops between "Move closer" and "Card cut off": a card spanning half the view width is close enough. Auto-capture tolerates normal hand shake and a flickery frame, and glare or poor light only delays the shot (about 1.5 s) instead of blocking it; such cards are flagged for review.

Version 0.2.0 (2026-10-20)

Added

- **Card scanner** (Scan card button, drawer → Scan cards): live card outline, one hint at a time ("Move closer", "Hold steady", "Glare, tilt the card", "More light"), automatic capture when the card is clear and steady, manual shutter, torch and tap-to-focus.
- Cards are straightened (perspective corrected) to at least 1400 px, read on the phone, and the new-contact form is filled in from the card; fields the reader was unsure of are marked amber.
- Back side: add the back of a card after the front; its details fill gaps the front left.
- Several cards at once: photograph a pile on a table, or pick several photos; each card is listed to review and save.
- Pick card photos from the gallery; works without a camera.
- Adjust corners by hand (with a magnifier) when the edges aren't found.
- Dark cards get a second, contrast-boosted reading pass.
- **QR codes on cards** are read too: a contact QR (vCard or MECARD) fills the form and wins over the printed text; where the two disagree the field is marked amber. A web-link QR shows its real domain, warns about link shorteners, look-alike characters and non-https links, and only opens when you tap it.
- **Review scan** screen: the card with a tappable box on every line of text; tap one and choose which field it belongs to, or draw a box with "Read a region" to read just that part. "Save and review next" moves straight on.
- **Review queue** (drawer → Review queue): every scanned card is stored the moment it's read and waits here until you check it, with counts for cards saved automatically today, cards to look at, and cards still being read. Swipe a card away to remove it (with undo).
- **Batch** scan mode: keep shooting cards one after another while they're read in the background; clear cards go straight to Contacts (Settings → "Save clear cards automatically", on by default), the rest wait in the queue. **Pile** mode reads several cards in one photo.
- Cards left unread when the app was closed mid-scan are picked up and read the next time it opens.
- **Updates from inside the app**: Settings → Updates → Check for updates shows what's new and installs the latest GitHub release over the current one (your contacts are kept). Optional check at startup, off by default; it's the only time CardKeep goes online and it sends nothing about you.
- The contact page shows the card (front and back) and opens it full screen to zoom.
- Card photos are stored privately in the app with location and camera data removed; a capture is saved before processing so nothing is lost if the app is closed mid-scan.

Fixed

- Emails that the text reader split with a space ("name@company. com") are joined back up.
- Two phone numbers on one line ("M … O …") each keep their own Mobile/Office label.
- Field confidence now follows the design (on-device reading, parser rule and cross-checks weighted together), so clearly printed cards are no longer sent for review unnecessarily.

Version 0.1.1 (2026-10-19)

Added

- Themes in Settings → Appearance: **Light**, **Medium** (grey) and **Dark** (black), all with CardKeep orange accents and orange primary controls; the original Navy and brass look stays as a fourth option. Switching is instant and remembered.

- **Match phone** theme (the new default): Light when the phone is in light mode, Dark in dark mode, switching live when the phone does.

Version 0.1.0 (2026-10-19)

First build for phone testing (milestone M1, "Contacts core").

Added

- Contacts list with search (names, companies, titles, emails, phone digits, notes), sort by name, company or recently added, an A–Z index, filters for Hot/Warm/Cold, follow-up due, moved and retired, and multi-select to rate, share as vCard or delete.
- Contact detail: call, email, text and share; tap any phone, email, website or address to open it in your default app; long-press to copy; lead rating; follow-up date with Done; dated notes; career summary and "Check on web" in your default browser.
- Add and edit contacts by hand: several phones (with a live check that the number is valid) and emails, website, address, company and title suggestions from existing contacts, lead rating, follow-up, notes and career tracking.
- Delete with Undo.
- Side drawer with every planned area; areas arriving in later versions say which version.
- Settings: phone region and search engine for web checks; version, privacy note and open-source licences.
- CardKeep name, launcher icons (adaptive and themed on Android), and brand mark.
- Debug builds only: OCR capture tool for building the card test set.
- Data layer: full database schema for later versions, card parser groundwork, vCard and CSV writers.
